FORMER POPOKI TARGET AREA

FORMERLY USED DEFENSE SITE August 2024

FACT SHEET

INTRODUCTION

This fact sheet presents an update on the U.S. Army Corps of Engineers remediation of the Former Popoki Target Area, a Formerly Used Defense Site (FUDS) located on the Big Island, at Makuu Popoki Halona, District of Puna (See map).

Approximately 640 acres were acquired by the U.S. Navy through a sublease (date unknown), either with W.H. Shipman, Ltd., or H. Blackshear, then executor of Shipman Estate. The site was reportedly used by the Navy as a target practice area during World War II. Though records could not be found to document such activity, ground reconnaissance revealed deteriorating air-to-ground practice bombs on site. The lease was cancelled on November 1, 1945.

CURRENT SITE STATUS

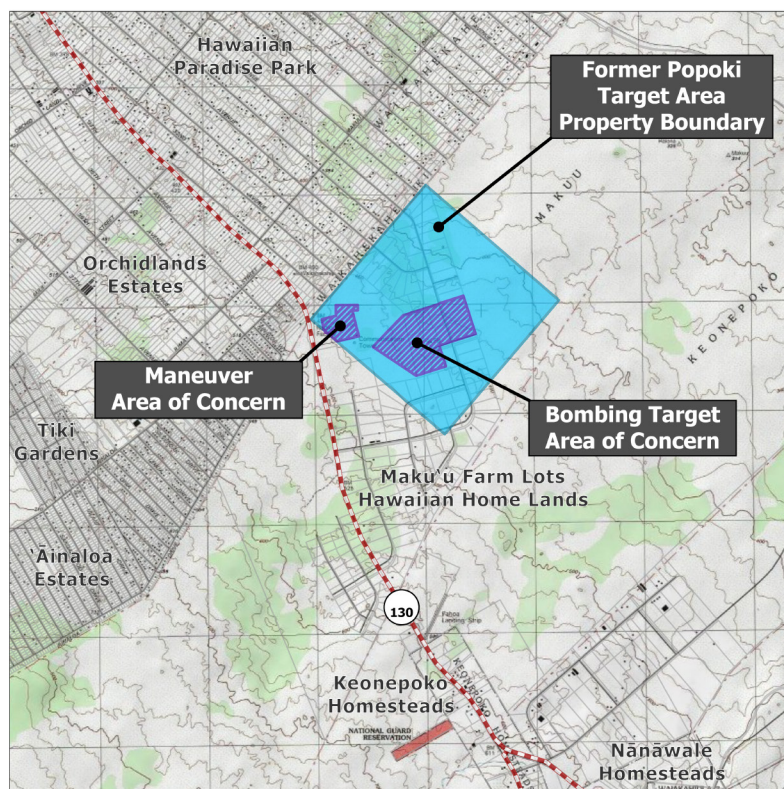

After completing investigations, removals and implementation of public outreach, the site is currently in long-term management. This phase provides a process for monitoring and ensuring public protectiveness including on-going public outreach and education and five-year reviews of site conditions.

PREVIOUS INVESTIGATIONS

A site visit was conducted in 1990 by Donaldson Enterprises, Inc. During the investigation of the site, two types of air-to-ground ordnance were identified within the Makuu Farm Lots subdivision. A total of 12 practice bombs were identified, one of which contained a spotting charge. The practice bombs were identified as AN-MK 23 practice bombs with AN-MK 4 spotting charges, and M38A2 100-lb water-/sandfilled practice bombs.

Another site visit was conducted by USACE in 1991. Since vegetation was dense and reached heights of six to eight feet, no evidence of munitions or explosives of concern (MEC) was discovered during this site visit. Subsequently, on December 31, 1991, an Inventory Project Report (INPR) was issued.

On July 7, 1992, based on the findings of the INPR, the Popoki Target Area was determined to have been formerly used by the Department of Defense (DoD) and was therefore eligible for the Defense Environmental Restoration Program FUDS, established under 10 U.S.C. 2701 et seq.

A Remedial Investigation (RI) Report of Popoki Target Area was completed in April 2006. As a result of former DoD ownership and use, MEC and munitions constituents (MC) potentially exist at the former Popoki Target Area and may pose a risk to human safety or health. The RI characterized potential risks and developed appropriate response alternatives to reduce human risks associated with MEC and MC items.

During the MEC risk assessment, the site was evaluated as two non-contiguous Areas of Concern (AOC) consisting of a bombing target and a troop training area, as shown in the figure below. Based on the results of the risk assessment, the potential MEC risk for the project site is assessed as low to moderate. However, the potential for encountering MEC at the site still exists.

A feasibility study (FS) was recommended to develop, screen, and analyze alternatives for remedial action at the bombing target and troop training area. The portion of the Popoki Target Area not located within the two AOCs was determined to require no further DoD Action. Additional MC sampling and analysis was not recommended since sampling during the RI found little to no MC.

The FS recommended subsurface removal of MEC and munitions debris (MD) from the 108 acres within the boundaries of the two AOCs. The subsurface removal will involve instrument-aided search and removal of all detected munitions-related items in these

areas, to a depth of two feet. Public education, which will help manage risks by educating the local populace concerning the potential explosive hazards at the site, was also recommended in the FS.

Following implementation of the recommended munitions response actions, USACE will maintain responsibility for the residual risk at the site by performing recurring reviews. The 5-year reviews involve returning to the site five years after the recommended munitions response actions have been initiated, to assess their effectiveness and reliability. After the initial review has been conducted, recurring reviews will be performed at 5-year intervals. The need for recurring reviews will be coordinated with regulators and stakeholders and justified in each recurring review report.

REMOVAL ACTION

USACE conducted a removal in 2011 in the areas of concern to reduce the risk of exposure to UXO by the public. The removal disposed of 96 UXO and 9,400 lbs. of debris from the site including practice bombs and a 60mm mortar.

EXPLOSIVES SAFETY: EDUCATION AND TRAINING

Despite USACE's discovery and removal actions, there is the potential that undiscovered UXO may remain in the area. As such, USACE has implemented an explosive safety outreach program to help protect the public from munitions risk in various project locations in the State of Hawaii.

The outreach program provides education and training at schools, community events, and organizational briefings to inform the public of the hazards of potential munitions and reduce or eliminate munitions risk using the guidance of the 3Rs (Recognize, Retreat, Report) of Explosives Safety Program. This training is also available from USACE upon request for private/non-profit organizations and government agencies.

Additionally, an annual 3Rs public safety awareness meeting is held every year for the Popoki Target Area announced with a public notice and letters to site landowners/beneficiaries.

To keep yourself and your friends safe

REMEMBER THE 3Rs

1. **RECOGNIZE** suspicious items and remember their locations
2. **RETREAT** without touching or going near them
3. **REPORT**: Call 911 and report what you saw

USACE conducted a removal in 2011 in the areas of concern to reduce the risk of exposure to UXO by the public. The removal disposed of 96 UXO and 9,400 lbs. of debris from the site including practice bombs and a 60mm mortar. Below are some practice bombs and a practice bomb dispenser excavated.
